Location	SW3, Chelsea
Area	30,000 sqft
Value	6.2 million
Duration	40 weeks

Outpatients and Diagnostics Centre

lateral concepts were appointed as the main Design & Build Contractor by HCA UK to fully refurbish and fitout their newly acquired Chelsea outpatient and diagnostic centre. The new centre has been designed to deliver cancer care in a convenient and comfortable setting for patients. The facility offers appointments across a range of specialties including dermatology, ophthalmology and gastroenterology and rapid cancer care provided by leaders in Oncology care.

The facility has a blood laboratory and aseptic pharmacy manufacturing suite. It also has a digital PET-CT scanner, one of the first in a private setting in London, to help diagnose and determine the stage of cancer earlier. lateral concepts facilitated this installation by constructing a brand new radiation shielded extension to the existing building.

The existing building was stripped down to the core; altering the existing reinforced concrete structure to incorporate a bed and passenger lift allows a smooth transition from main entrance to treatment room. The whole building has received a full mechanical and electrical replacement, ensuring the highest level of comfort and surroundings during treatment; the end user being the key in the building's creation and successfully unlocking it's potential.

Project Facts

- The first PET-CT scanner installed in London within a private healthcare facility
- HTM and BS compliant.
- Creating spaces for the highest level of healthcare treatment.
